

Education Labs Take Home Assignment

Context

As AI systems become more capable, we face two critical challenges in human-AI collaboration:

1. **Discovery & Mastery:** Users often use only a fraction of AI capabilities because they don't know what's possible or how to effectively use advanced features. This limits the value they get from AI tools.
2. **Cognitive Engagement:** When AI agents handle complex tasks autonomously, humans can become passive observers rather than active learners, missing opportunities to develop their own skills and understanding.

Objective

Build a functional prototype that demonstrates how AI can enhance human learning and agency in one of these two areas:

Option A: Helping users master Claude

Design a feature or system that helps users progressively discover and master AI capabilities through **integrated, contextual learning experiences** (think how video games teach complex mechanics through gameplay itself—not just tutorial videos or product tours). Your prototype should demonstrate an intuitive, creative approach to in-app learning.

Consider these angles as potential areas to address (your prototype doesn't need to solve all of these, but should thoughtfully engage with at least one):

- Help users understand what AI can do for them in context of their actual work
- Guide users from basic to advanced usage patterns through active experimentation
- Build user confidence and expertise over time via progressive challenges or achievements
- Make powerful features discoverable and learnable at the moment of need

For the purpose of this assignment, assume that the goal is to increase the complexity of workflows for users who have already been using Claude at least for a little bit, not onboarding beginner users to their first use cases or workflows.

Option B: Learning through collaboration with Claude

Design a feature that helps users actively learn and develop skills while working with AI. Your prototype should demonstrate how to:

- Help users develop domain expertise (e.g., become better programmers, writers, analysts)
- Transform AI-assisted work into learning opportunities
- Build deeper understanding of subjects through AI interaction
- Ensure users grow their capabilities, not just complete tasks

Time expectation

- <1 day (we value your time and prefer depth over breadth)

Requirements

Create three deliverables:

1. **A functioning prototype (deployed)**
 - The Anthropic team should be able to use and interact with the prototype
 - Leverage the Claude API
 - Feel free to focus on a single feature or interaction pattern
 - Polish is less important than demonstrating your core idea effectively
2. **Your code**
 - You'll submit the code behind your functioning prototype via GitHub repo link
 - You shouldn't ignore code quality, but it's not the primary part of this activity
 - Feel free to use any languages/technologies you're comfortable with
3. **Design rationale**
 - Use both formats: self-recorded video & a short written doc outlining the problem and solution
 - Which option you chose and why
 - Your design and prototyping process to arrive at your submitted prototype
 - How your design enhances rather than replaces human agency
 - What learning principles informed your decisions

- How you'd measure success
- How your solution could scale to millions of users

What we're looking for

- **Technical execution:** Can you rapidly build something functional that demonstrates your idea and iterate on it?
- **Growth-first thinking:** Does your prototype genuinely enhance learning and skill growth rather than just supporting productivity?
- **User empathy:** Do you understand the needs of learners and educators?
- **Clear communication:** Can you articulate your design decisions and rationale?
- **Creative problem-solving:** How do you approach ambiguous challenges?
- **Scalability thinking:** Can your solution generalize and work for diverse users and use cases?

Use of Claude

You are encouraged to use Claude for both coding and any explanation artifacts. However, we are assessing your discernment and judgment in guiding Claude, not Claude's raw output. Candidates who submit Claude's outputs without demonstrating their own perspective, guidance to Claude, or design decision explanations will not pass. We want to see your thinking process - how you evaluate options, make trade-offs, and guide Claude toward executing on your ideal vision.

Tips

- You can build features on any Claude product, not just Claude.ai!
- We highly encourage using AI tools (Claude.ai, Claude Code or your favorite AI code editor, etc.) to help you build!
- Start with a specific user journey or learning challenge rather than trying to solve everything
- Consider different user segments and how your prototype needs to fit into a product that serves multiple user segments (e.g., beginners vs power users, students vs professionals)
- 'Simple but thoughtful' beats 'complex but confusing'
- Think about how your prototype could integrate into existing AI products
- It's ok to build on top of something you've made yourself in the past, but please add to it and explain your additions

Submission

Please submit over email:

- **GitHub repo link** with your code
- **Link to your working prototype** (can be hosted anywhere)
- **Claude transcript(s)** - Complete transcripts from Claude and / or Claude Code showing your entire interaction history with Claude for this assignment
- Your **explanation artifacts** (video + short written doc)
 - The video should involve a screenshare walkthrough of what you built
 - **Please ensure your video is no longer than 8 minutes long**
